WPI; 1998-001790/01. N-PSDB; AAV09401 DNA encoding interleukin-1 beta converting enzyme apoptosis protease-6 useful to develop products to treat, e.g. viral infection, tumour, Alzheimer's disease, inflammation, osteoporosis and AIDS.

Claim 4; Fig 1; 44pp; English.

This is a human interleukin-1 beta converting enzyme apoptosis protease-6 (ICB LAP-6) polypeptide. The ICB LAP-6 polypeptide and agonists to the polypeptide can be used to induce apoptosis, e.g. as an antiviral or antitumour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICB LAP-6 polypeptide can be used to treat, Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic

The present sequence is an alternative version of human Caspase-9 also known as interleukin-1 converting enzyme (ICE) LAP6 and Mch6. Caspases care a family of cysteine proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A twision polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion polypeptide is used to cleavage. An expression cassette containing fusion polypeptide is used to cleavage. An expression cassette containing fusion polypeptide is used to cleavage. An expression cassette containing fusion polypeptide is used to cathepsin Bor urokinase, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy. Note: This sequence Cathepsin Bor urokinase, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy. Note: This sequence Cathepsin Done and the same as that shown in page 105-107 caveral positione
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ASHLOFPGAVYGTDGCPVSVEKIVNIFNGTSCPSLGGKPKLFIQACGGGKDHGFEVAS 300

Claim 36; Page 25-26; 52pp; English.

The invention relates to an isolated nucleic acid molecule comprising a polymercleotide that encodes a polypeptide or peptide, or its variants computed that encodes a polypeptide or peptide, or a polypeptide apportosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 N-terminal linker sequence, a first portion of a procaspase-9 that specifically binds at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and lacks cysteine or polypeptide exhibits caspase-3 mortion of caspase-3, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild cype caspase-9 enzymatic activity, a nucleic acid molecule comprising a polynucleotide sequence that encodes the caspase-9 N-terminal linker), and expression vector comprising any of the nucleic acids, a host cell containing the expression vector, an antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to containing the expression and antibody that specifically binds to the peptide or polypeptide, an antibody that specifically binds to in a cell or stimulating apoptosis in a neoplastic or tumour cell, identifying an inhibitor or enhancer of caspase-9-pi2, inducing apoptosis

```
producing a compound for inhibiting or enhancing apoptosis in a cell, and a process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell. The nucleic acid molecules and peptides or polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDS, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence represents the full length caspase-9 protein.
                                                                                                                                                                                                                                                                                                                                                                                     180
                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                   240

The invention relates to an isolated nucleic acid molecule comprising a polymucleotide that encodes a polypeptide or peptide, or its variants that encodes a polypeptide or peptide, or its variants apoptosis protein (IAP). Also included are a peptide or a polypeptide or poptosis protein (IAP). Also included are a peptide or a polypeptide or peptidis at least an N terminus sequence of caspase-9 N-terminal links sequence, a first portion of a procaspase-9 that specifically binds at least a portion of a procaspase-9 that specifically binds at least a portion of an IAP and a second portion of a procaspase-9 that second portion of a procaspase-9 that second portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP bir3 domain) or at least a portion of a mutated procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild procaspase-9, which fails to undergo normal processing and possesses wild polynucleotide sequence that encodes the caspase-9 N-terminal linker), and expression vector comprising any of the nucleic acid molecules comprising any of the nucleic acids and postosis, or the peptide or polypeptide, an antibody that specifically binds to an epitope located on the N-terminus of a caspase-9-pl2, inducing apoptosis, in a cell or stimulating apoptosis in a neoplastic or tumour cell, identifying a compound that inhibiting or enhancing apoptosis in a cell or antibior or enhancer of caspase-process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell in the manufacture of a compound for inhibiting or enhancers of apoptosis for treating Albia, neurodegenerative diseases, or enhancers of apoptosis for treating Albia, neurogenerated to a process the presents s 0 240 ASHLOFPGAVYGTDGCPVSVFKIVNIFNGTSCPSLGGKPKLFFIQACGGEQKDHGFEVAS 300 120 61 DLETRGSQALPLFISCLEDTGQDMLASFLRINRQAAKLSKPTLENLTPVVLRPEIRKPEV 120 180 09 DLETRGSQALPLFISCLEDTGQDMLASFLRTNRQAGKLSKPTLENLTPVVLRPEIRKPEV TGSNI DCEKLRRRFSSLHFMVEVKGDLTAKKMVLALLELARQDHGALDCCVVVILSHGCQ LRPETPRPVDIGSGGFGDVGALESLRGNADLAYILSMEPCGHCL1INNVNFCRESGLRTR 1 MDEADRRILRRCRIRLVEELQVDQLWDALLSRELFRPHMIEDIQRAGSGSRRDQARQLII MDEADRRILIRRCRIRLVEELQVDQLWDVLLSRELFRPHMIEDIQRAGSGSRRDQARQLII Gaps . information in the claims and the wild type caspase-9 sequence Score 2158; DB 6; Length 416; Pred. The invention relates to nucleic acid molecules encoding rev-caspases.

Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small consultation and is expressed as a zymogen, in which the small comprising a rev-caspase coding sequence is useful for the treatment of comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. The gene delivery vehicle can also be used to treat autoimmune diseases. The gene delivery consors or enhancers of caspase—mediated apportosis. In the treatment of inhibitors or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibitor or enhancer of caspase processing activity. Caspase inhibitions are useful for treating neurodegenerative diseases as well as for inhibiting apposit of processing activity. Caspase inhibitions are useful approached in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10 cape products (AAX812715-Y21724)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated gene encoding MCH6 (mammalian ced-3 homologue 6) an aspartate-specific cysteine protease and the MCH6 polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to diagnose, treat (e.g. by gene therapy) or reduce the severity of cell death-mediated diseases (i.e. apptocic) such as neurodegenerative diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa and cerebellar degeneration, and myelodysplastic syndromes, e.g. aplastic anaemia, ischaemic injury, myocardial infarction, stroke and reperfusion injury. The MCH6-encoding nucleic acids and polypeptides can also be used to diagnose or generate reagents to diagnose diseases mediated or characterised by programmed cell death. A purified recombinant MCH6 protein can be used to measure hydrolysis rates for various substrates such as DEVD-AMC and YVAD-AMC in protein can be used to and available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            IRPETPRPVDIGSGGFGDVGALESIRGNADLAYILSMEPCGHCLIINNVNFCRESGLRTR 180

```

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell deathmediated diseases, as well as other diseases mediated by either increased mch6

                                                   The present sequence represents a human apoptotic protease, designated Mch6. Mch6 is an aspartate-specific cysteine protease. Mch6 polypeptides and polymucleotides can be used to diagnose, treat or reduce the severity of cell death-mediated conditions, e.g. cancers, autoimmune diseases such as systemic lupus erythematosus, viral infections such as herpesvirus, despenerative disorders such as Alzheimer's disease and parkinson's disease, myelodysplastic syndromes such as myocardial infarction and stroke. They can also be used to screen for compounds that inhibit or promote Mch6 mediated apoptosis
                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                          The invention relates to determining a prognosis for survival for a cancer patient. The method involves (a) measuring a level of a tumour upregulated CARD-containing antagonist of caspase-9 (TUCAN) in a neoplastic call-containing sample from the cancer patient, and (b) comparing the level of TUCAN in the sample correlates with increased survival of the patient. Alternatively, the method involves measuring levels of TUCAN and patient. Alternatively, the method involves measuring levels of TUCAN and one or more biomarkers selected from the group of clAPP, Apafl, Bcl-2, or Smac in a neoplastic cell-containing sample from the cancer patient. The method is useful for determining if the patient is at risk for relapse, or for determining a proper course of treatment for a patient with cancer. The method is also useful for monitoring the effectiveness of a conterposition of the patient with cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated gene (I) encoding Mch6 (mammalian ced -3 homologue 6), or a functional fragment of it. (I) And the polypeptide encoded by (I) is used to modulate apoptosis for the therapeutic treatment of human diseases. (I) Is used to prepared a recombinant aspartate-specific cysteine protease, that it encodes. The recombinant protease can be used to screen for Mch6 inhibitors. Disorders involving encodes, including cancers, viral infections, degenerative disorders, such as Alzheimers and Parkinsons disease, and myocardial infarction. This is the amino acid sequence of human mammalian ced-3 homologue 6 (Mch6), a member of the aspartate-specific cysteine protease (ASCP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

```
The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of aportosis protein (IAP). Also included are a peptide or a polypeptide or apolyceptide or apolyceptide or apolyceptide or apolyceptide or comprising at least an N terminus sequence of caspase-9 that specifically binds at least a portion of a procaspase-9 that specifically binds at least a portion of a procaspase-9 containing a mutated active site, where the peptide or polypeptide or specifically binds at least a portion of caspase-3, where the peptide or polypeptide exhibits caspase-3 aportion of asspase-3, where the peptide or polypeptide exhibits caspase-3 aportion of a mutated or polypeptide exhibits caspase-3 aportion of a mutated or polypeptide exhibits caspase-3 aportion of a mutated or procaspase-9 enzymatic activity, a nucleic acid molecule comprising a polymucleotide sequence that encodes the caspase-9 N-terminal linker), and expression vector compising any of the nucleic acid molecule colling an expression vector compisising an any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and a new particular and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids any and any of the nucleic acids and any of the nucleic acids and any of the nucleic acids and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; caspase-9; anti-HIV; nootropic; neuroprotective; vasotropic; cytostatic; immunosuppressive; inhibitor of apoptosis protein; IAP; caspase-9 N-terminal linker; procaspase-9; cysteine protease; caspase-3; Bir3 domain; apoptosis; AIDS; neurodegenerative disease; epitope located on the N-terminus of a caspase-9-p12, inducing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, identifying an inhibitor or enhancer of caspase-mediated apoptosis, producing a compound that inhibits the peptide or polypeptide, process for the manufacture of a compound for inhibiting or enhancing apoptosis in a cell, and apoptosis in a cell, The mucleic acid molecules and peptides or polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancers of apoptosis for treating AIDs, neurodegenerative diseases, ischaemic injury, cancer, autoimmune diseases. The present sequence is protein mutated to ablate the autocatalytic claavage site in the linker region. Note: the present sequence is not shown in the specification but was created by the indexer using the information in the claims and the wild type caspase-9 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

The invention relates to an isolated nucleic acid molecule comprising a polynucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of appotosis protein (IAP). Also included are a peptide or a polypeptide or appotosis protein (IAP). Also included are a peptide or a polypeptide or comprising at least an N terminus sequence of caspase-9 hat specifically binds at least a portion of a procaspase-9 hat specifically binds at least a portion of an IAP and lacks cysteine or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP or an IAP bir3 domain) or at least a portion of a macks cysteine or polypeptide exhibits caspase-3 enzymatic activity that is inhibited by an IAP or an IAP bir3 domain) or at least a portion of a must eight or procaspase-9, which fails to undergo normal processing and possesses wild type caspase-9 enzymatic activity, a nucleic acid molecule comprising a polypucleotide sequence that encodes the caspase-9, host cell containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing the expression vector, an antibody that specifically binds to containing a compound for inhibiting or enhancing apoptosis in a cell or stimulating apoptosis in a neoplastic or tumour cell, indentifying a compound for inhibiting or enhancing apoptosis in a cell, and apoptosis and identifying an acell or the manufacture of a compound containing apoptosis and identifying an indivitor or enhancer of a compound containing apoptosis and identifying inhibitors or polypeptides are useful for inducing apoptosis and identifying inhibitors or enhancer of a compound contained are useful for inducing apoptosis and identifying inhibitors in cell in the entered accidence of a compound contained are useful for inducing apoptosis and identifying an enhancer of a compound contained an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ischaemic injury, cancer, autoimmune diseases. The present sequence represents the caspase-9 protein mutated to ablate the autocatalytic cleavage site in the linker region. Note: the present sequence is not shown in the specification but was created by the indexer using the information in the claims and the wild type caspase-9 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ischaemic injury, cancer, autoimmune diseases. The present sequence represents the caspase-9 protein mutated to ablate the autocatalytic cleavage site in the linker region. Note: the present sequence is not shown in the specification but was created by the indexer using the information in the claims and the wild type caspase-9 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LRPETPRPVDIGSGGFGDVGALESLRGNADLAYILSMEPCGHCLIINNVNFCRESGLRTR

The invention relates to an isolated nucleic acid molecule comprising polymucleotide that encodes a polypeptide or peptide, or its variants that specifically binds to at least a portion of an inhibitor of apoptosis protein (IAP). Also included are a peptide or a polypeptide (comprising at least an N terminus sequence of caspase-9 N-terminal linker sequence, a first portion of a procaspase-9 that specifically
